

Will this change our workflow?

Tags: [Flow](#)

For most Flow reports, you won't need to change your workflow. Flow report data is generated when your developers check in code, update tickets, create PRs, and more.

But every engineering team is unique and approaches their work differently. Flow provides powerful configuration options to help make Flow work better with the unique aspects of how you work. Once Flow is configured, you'll get to spend less time bothering people to ask what they're working on.

With changes to your workflow and new features being added to Flow, you'll want to spend time regularly to keep Flow configured the best way for you, your workflow, and your team's uniqueness. This will not only enable you to have the most accurate data, but also let you take advantage of new and updated Flow features.
