

Request URL in the Flow API

Who can use this?

Core Plus
✓

The request URL is a string representing the URL of the request. The URL syntax looks like:

Request URL

```
https://flow.pluralsight.com/v3/customer/core/users/?limit=3
```

```
[protocol]://[hostname][api version][customer/core][object][parameter(s)]
```

Where:

- **Protocol** is the network protocol used to make the request. For security reasons, requests to the Flow API must always use the https protocol.
- **Hostname** is the IP address or URL for the Flow application. If you're using an on-premise version of Flow, this is something other than flow.pluralsight.com.
- **API version** refers to the version of the API being accessed.
- **/customer/core** is always be the same.
- **Object** is the resource in the Flow API from which you want to extract data. Examples are **users**, **commits**, and **targets**. See [customer API \(\)](#) for the complete list.
- **Parameter(s)** are the filters you use to extract a specific result, such as an Id, or a query parameter to restrict the result to a specific set of data. Parameter passing follows the widely used ? **key=value&pattern**.
